

# Online pizza ordering website

**Abstract:**

In this project I'm going to create a website for users to order pizzas from website. So my project will consist of signup and login pages where users have to login in order to make their orders. If he don't have an account then he can create an account using the signup option. After login he can view the various items in the menu and can add the items he wants to cart. He can add as many pizzas as he wants in the cart and then he can proceed to the billing page where the total cost of the order will be displayed. User can add an item to the cart and can also delete a particular item from the cart which he doesn't want(CRUD operations). After proceeding to the billing page the user has to give his address details and then press the place order button. Hence, the order will be placed successfully. Users can also send feedback based on the services from the website. Users can also update his profile info.
